Ano sasagot mo pag ni judge ung system nyo

hindi ba monitoring system lng to? Fokkin beach

Monitoring is the input, not the final purpose. The system collects workstation data, but that data drives the rest of the system. Abnormal metrics generate alerts, alerts lead to diagnosis, diagnosis can lead to controlled actions such as terminating a process or restarting a workstation, those actions are logged, and historical data is analyzed to identify recurring problems and support preventive maintenance. Therefore, the system is a workstation monitoring and management system rather than a monitoring-only system.

So what happens to the data?

The data is not collected simply for display. It is used to trigger alerts, support troubleshooting decisions, execute controlled workstation actions, document administrative actions, and generate historical analysis for preventive maintenance.

Different types of data have different purposes. Real-time workstation metrics are used for immediate monitoring and detection. Alerts are generated when abnormal conditions occur. Diagnostic information is used by staff to identify and resolve problems. Administrative actions are recorded in logs for accountability. Historical performance and alert data are retained for analytics, allowing the system to identify recurring workstation problems and support maintenance decisions.

How to frame it:
We are not just asking what is happening to the PCs. We are using workstation data to determine what needs attention, what action can be taken, what happened afterward, and what recurring patterns require maintenance.

Leave Disk Space out of the core monitoring metrics.

Then your troubleshooting story becomes:

“We monitor disk activity because disk I/O is one of the workstation resources that can directly affect system responsiveness. Unlike disk-space monitoring, our purpose is not to manage user files. We use disk activity to detect abnormal workloads, identify processes contributing to high disk usage, support troubleshooting, and track recurring performance issues.”

Dashboard

Purpose: Immediate operational control.

“What is happening to my PCs right now?”

Troubleshoot

Purpose: Diagnose and resolve problems.

“Why is this PC having a problem, and what can I do about it?”

Health

Purpose: Identify recurring problems and support maintenance decisions.

“Is this PC becoming problematic over time?”

Alerts

Purpose: Turn detected abnormal data into actionable notifications.

“Does someone need to intervene?”

Logs

Purpose: Accountability and traceability.

“Who did what, to which PC, and when?”

Analytics

Purpose: Turn historical data into patterns and decisions.

“What problems keep happening, and which PCs need attention?”

Archive

Purpose: Preserve historical workstation records without cluttering the active environment.

“What happened to PCs that are no longer active?”

Sa fokin disk usage yan dahil nakakalito ngani, in short isang storage lng ichecheck kung ilan na usage or laman

"the quick-glance disk % tracks the system drive specifically, since that's the one most critical to PC performance, while the detailed specs modal shows total storage across all drives for inventory purposes."

Ano rebat pag pinipilit ang kupal na remote access
“The system doesn't need full remote desktop access to accomplish its defined management functions. It needs controlled remote administrative actions.”

They may say:

“But if you can take screenshots, why not just make it remote desktop?”

Because a screenshot is diagnostic information, while remote desktop is interactive control of the entire workstation environment.

“If we add full remote desktop, the project changes from workstation monitoring and management into remote-access software. That substantially expands the technical scope without being necessary to satisfy our primary objectives.”

But what if they say: "Remote desktop is necessary for troubleshooting"?

This is where you should **agree partially instead of fighting them**.

Say:

“Remote access can certainly be useful for troubleshooting, but usefulness does not necessarily make it a core requirement of this system.”

“We are not excluding remote control. We are limiting remote control to controlled administrative operations relevant to workstation management.”

Core scope:

Centralized monitoring, session management, troubleshooting, health monitoring, alerts, controlled remote administrative actions, logging, and analytics for Pisonet workstations.

Controlled remote actions:

The system may remotely perform predefined administrative actions such as locking, restarting, shutting down, terminating selected processes, and capturing temporary screenshots.

Out of scope:

Full interactive remote desktop functionality, including continuous remote screen streaming and remote mouse/keyboard control, is outside the core scope of the system and may be considered as a future enhancement.

Don't say **“remote desktop will never be included.”**

Say:

“It is a potential future enhancement.”

If they ask: "Then isn't this just monitoring?"

Your answer is basically already in your concept:

“No. Monitoring is only one component. The system also manages workstation sessions, enforces timers, provides controlled administrative actions, supports troubleshooting, generates alerts, records administrative actions, and analyzes workstation health and performance.”

And then add:

“Remote desktop is a different capability because it provides unrestricted interactive access to the workstation. Our system instead provides targeted administrative controls designed specifically for Pisonet workstation management.”

That's probably the **cleanest defense**.

The one sentence I'd remember for your defense

“Our objective is not to remotely operate the workstation; our objective is to centrally monitor, diagnose, and manage its operational state.”

If they push back, follow it with:

“Full remote desktop is therefore a possible enhancement, but making it a core requirement would expand the project into remote-access software and move beyond our defined workstation-management scope.”
